Category:	Unknown	
Pull Request or Patch supplied:		
Easy fix?:	No	
Description		
<p>When a user try to load styles from public.layer_styles that are not referred to the vector at hand (the query selectOthersQuery in function listStyles in file ~qgis/src/providers/postgres/qgspostgresprovider.cpp) the results are sorted by update_time desc.</p> <p>From the perspective of the user, the order of the results seems randomic.</p> <p>When there are many results, finding the desired style is difficult even knowing its name, the name of the table and so on.</p> <p>Since stylization often depends on the attributes of the vector, it would be useful to know also table name and table schema.</p> <p>I propose to modify the dialog and the query as follows:</p> <ol style="list-style-type: none">1. dialog exposes also table_catalog, table_schema, table_name and update_time2. results are sorted by table_catalog, table_schema, table_name and update_time (desc)3. results are sortable clicking table column headers <p>The best would be to provide also a text box to filter the results applying partial text match on all column data.</p>
