

QGIS Application - Bug report #10567

ERROR in attributes cells in spatialite layer table

2014-06-12 07:42 AM - enrico ferreguti

Status:	Closed	
Priority:	Normal	
Assignee:		
Category:	Data Provider/Spatialite	
Affected QGIS version:	2.2.0	Regression?: No
Operating System:	windows xp	Easy fix?: No
Pull Request or Patch supplied:		Resolution: worksforme
Crashes QGIS or corrupts data:		Copied to github as #: 18974
Description		
<p>When I load a spatialite view as layer I see it right on map and I can get info, but when I open the attributes table I get always ERROR values. The view was create with Qspatialite plugin.</p>

it is a plugin or QGIS issue? what happens if you create the view in DB manager? or from the SL command line? or SL gui?

Having the same issue, it is a QGIS issue as I used the spatialite icon to add the layer. I created the view outside of QGIS directly using spatialite\_gui so this means the problem is within QGIS.

When you use the identify results button you get the table information but if you open the attribute table what you get is ERROR in all the cells.

When I try to select one single feature from the view using the select tool all the features get selected, so this may be also related to this issue.

I have just tested on QGIS 2.4 on Linux and I can't replicate the same issue. I used a SL database created empty in QGIS 2.4 and imported a shapefile in it with DB manager. The view then was done using spatialite\_gui.

Please attach the SL db that contains the layer and the view.
