Assignee:	nobody -			
Category:	Symbology			
Pull Request or Patch supplied:			**Resolution:**	fixed
Easy fix?:	No		**Copied to github as #:**	11121

Description

It could be useful to graphically represent different kind of informations related to a single point of interest; these informations are stored in the layer's database, for example in the form of a filename of the picture chosen to represent the value of that particular attribute.

Example: in the attached picture can be seen two points of interest with different informations displayed as symbols; the filename of the graphic symbol is used to show the information, and "null.svg" in an empty symbol to use when that particular characteristic is not present.

- *Resolution set to fixed*

- *Status changed from Open to Closed*

With new symbology it's possible to draw multiple symbols for a point. Moreover there's a point displacement renderer which is able to align the symbols automatically.
