Pull Request or F	Patch supplied:	Resolution:	
Easy fix?:	No	Copied to github as #: 19124	
Description			
Actually when labe	lling a line dataset is available	ne parallel, curved or orizzontal.	
The curved is sma	rt when labelling a street or a r	er.	
The curved need to	o defin a maximun angle betwe	n character to avoid the verlaps of character.	
But when the river	or the street is really curved th	mean the labeli not put on map.	
This could be acce	ptable for a topographic of par	pramic map, but not for a tematic map where the name o	f rivers need to be
available all, and n	ot some one yes and someone	other no.	
Also this is more in	portant for a printable map in	ead of a dynamic zoomable map where the user can inc	rease the zoom and see the
label before absen	t.		
So a good enhance	ement is give the opzional cho	e to the user that when choose the "curved" placement it	t can say
"use the curved pla	cement with these angles", bu	if is not possible to set a label , please put using the para	allel placement."
Infact is surely bett	er to have one label parallel in	ead of no label.	
So the enhancmen	t is to have a curved placemer	that allow also (opztionally) use the parallel placement v	when the curved is not possible
for one label.			
Just a detail:			
I speak to a single	object level, so at the end we	II have a map where the dataset river has many rivers us	sing label curved and two or
		than the curved but visible and readable.	
three river with a la	bel placed parallel surely wors		
three river with a la Related issues:	bel placed parallel surely wors
