## Description

Hello,

in QGis 2.4, it seems to be impossible to join two memory layers together.
When I try to add a new join on the "Joins" tab of a layer, other memory layers are not displayed in the list for "Join layer" widget.

This feature could speed the task to join attributes of two huge layers that can fit in memory (for speed purposes).

Thank you for this work...

Hi, I would raise it to high priority and not as a feature, but an issue. It used to work in 1.x and I miss it. Régis

*- Resolution set to fixed/implemented*

*- Status changed from Open to Closed*

Hello, bug triage...

it seems that in QGIS 2.13 master, we can join two memory layers.

I am closing this one !
