Pull Request or Patch supplied:		Resolution:
Easy fix?:	No	Copied to github as #: 19599
Description		
<p>It would be useful in many cases to have a dynamic mouse coordinate readout in additional CRSs besides the canvas CRS. These additional CRSs could be chosen from a layer or from the CRS catalog and the readout(s) could be to the left of the canvas coord readout in the status bar.</p> <p>One use case is for working in a south-oriented CRS (as in South Africa) and wanting to view the map with north up but still see south-oriented coordinates.</p> <p>An additional option in the south-oriented case would be to flip the canvas instead from the usual enu to wsu.</p> <p>As an interim solution for the first option above is to use the coordinate capture plugin, although tracking the alternative coordinates stops when you switch to other tasks.</p>
