

QGIS Application - Bug report #11533

Crash when doing right-click Identify/action on PostGIS layer

2014-11-03 09:04 AM - Nathan Saylor

<b>Status:</b>	Closed

<b>Affected QGIS version:</b>	2.6.0	<b>Regression?:</b> No
<b>Operating System:</b>	Windows	<b>Easy fix?:</b> No
<b>Pull Request or Patch applied:</b>	No	<b>Resolution:</b>
<b>Crashes QGIS or corrupts data:</b>	Yes	<b>Copied to github as #:</b> 19803
<b>Description</b>		
<p>Right-click using the Identify tool for option to bring up Identify dialog or use Action on a PostGIS layer. The Action in this case is to open a webpage based on an attribute. Selecting Identify works fine. Selecting the Action crashes QGIS and creates a dump file. I have also tested PostGIS layers via GeoServer and stand-alone shapefiles and both of these work as expected. Using the Action button on PostGIS layer works as expected. So far, it is only right-clicking with the Identify tool and selecting Action that causes the crash.</p>

it is not clear to me what brings down your qgis, the identify tool or the action one?

I tested both on a PostGIS layer here (the action is the same as you described) and none of them causes crash.

Please try see if you have an offending plugin, disable/remove all 3rd party plugins, close qgis and try again. Thanks.

Using the Identify tool, right-clicking on a PostGIS layer feature, and selecting the Action option crashes QGIS. I have tried disabling all plugins but get the same result. Is that enough, or do I need to uninstall them as well? Thank you for your prompt response.

- Status changed from Feedback to Open

- *Target version set to Version 2.8*
- *Priority changed from High to Severe/Regression*

Confirmed on Windows, will try also Linux. Tagging as blocker as is a new feature that does not work as expected, feel free to downgrade it.
