Crashes QGIS or corrupts data: Copied to github as #: 19872

Description

See bug #11594 for additional background.

I have a multipolygon layer on which I have applied an inverted polygon symbology with a shapeburst fill. At certain scales, the layer disappears from the canvas. In my latest testing, it was visible up until I zoomed out to about 1:110,000 and would reappear at about 1:650,000.

The disappearance does not occur if the layer is symbolized using a simple fill.

History

#1 - 2017-05-01 01:07 AM - Giovanni Manghi

- Easy fix? set to No
- Regression? set to No

#2 - 2019-03-09 04:09 PM - Giovanni Manghi

- Resolution set to end of life
- Status changed from Open to Closed

End of life notice: QGIS 2.18 LTR
