Description

Hi,

Great feature than the ability to attribute multiple styles to a layer in a project.

When in layer properties > Style, you load an existing style (from file or DB), I think it'll be better if this style was appended to the list of existing styles (with its registered name) and even set active instead of overwriting the active one.

Now, to avoid overwriting previous style, you need to create a new ("useless") style, set it active and then load the one you are expecting. This process can be improved with the above proposal.
