

QGIS Application - Bug report #12057

Computed area is wrong when reprojection is active

2015-01-26 03:30 AM - Harrissou Santanna

Status: Closed Priority: Severe/Regression Assignee: Category: Vectors Affected QGIS version: master Operating System: Pull Request or Patch supplied: Crashes QGIS or corrupts data:	Regression?: No Easy fix?: No Resolution: fixed/implemented Copied to github as #: 20259																		
Description New description: with OTFR on the area returned by the field calculator or the identify tool is completely wrong. Moreover the area is always computed in square meters even if CRS is in feet (see #10966). Tested on QGIS 2.8 and master <hr/> Select Identify tool click on a feature read the results in the Identify panels the value shown for the area is 0,000 square meter. see attached file. QGIS master 7b1f9ee Osgeo4W 64 bits

History

#1 - 2015-01-29 07:49 AM - Giovanni Manghi

- Priority changed from Severe/Regression to Normal
- Category set to Vectors
- Status changed from Open to Feedback
- Target version deleted (Version 2.8)

Cannot confirm here, please attach a sample data.

Does it returns the right result, with the very same data and project, using an older qgis version than master?

#2 - 2015-01-30 12:39 PM - Harrissou Santanna

- Status changed from Feedback to Closed

Yes, QGIS 2.6 gives right value for the same layer/feature.

But this issue can be closed, as next version of master has solved it.

#3 - 2015-02-24 01:23 PM - Donovan Cameron

- File *wildlife_management_areas.zip* added

- Status changed from Closed to Reopened

Sorry, I don't have a master version to test against and using 2.8.0 on linux, but when OTF is turned on, the derived area from the identify tool always says 0.000 m2.

I've attached a sample dataset for testing.

#4 - 2015-02-24 02:20 PM - Giovanni Manghi

- Target version set to *Version 2.8.1*

- Priority changed from *Normal* to *Severe/Regression*

This was certainly working in previous qgis releases, like 2.0.1

#5 - 2015-04-10 06:08 AM - stefano nardone

Does the same here too: derived identify information area is shown as zero square meters with On The Fly CRS transformation active, works correctly if I have OTF disabled. QGIS 2.8.1 + Linux Ubuntu 14.04.2 LTS

#6 - 2015-04-14 06:19 AM - Giovanni Manghi

- Subject changed from *Identify Tool gives wrong derived area* to *Computed area is wrong when reprojection is active*

#7 - 2015-04-22 03:06 PM - Maxim Broos

For sake of completeness:

This is a gis.stackexchange discussion on the same topic:

<http://gis.stackexchange.com/questions/143080/qgis-area-calculation-differs-when-on-the-fly-crs-transformation-enabled/>

#8 - 2015-04-23 04:16 AM - Gerhard Spieles

see also #3296

#9 - 2015-05-06 02:24 PM - Stefan Blumentrath

I can confirm this issue on Windows 7, QGIS 2.8.1 and 2.6.1 (both 32bit). In addition I had a very similar issue with distance measuring. After changing CRS forth and back (due to adding and removing an OpenLayers map) the length measurement tool reported the width of a regular grid I created to be 500m, yet I know it was 250m. After deactivating OTF-projection and restarting QGIS everything was OK again...

#10 - 2015-05-10 12:54 AM - Giovanni Manghi

- Target version changed from Version 2.8.1 to Version 2.8.2

#11 - 2015-05-10 01:04 AM - Jürgen Fischer

- Target version changed from Version 2.8.2 to Future Release - High Priority

#12 - 2015-05-10 01:59 AM - Giovanni Manghi

see also #10966 ("with OTFR on \$area is always computed in square meters even if the CRS is in feet").

Maybe worth writing a test for this bug, given its history.

#15 - 2015-05-21 04:56 AM - Martin Dobias

- Status changed from Reopened to Feedback

The problem is most likely the same as #12406 - please try again with the latest master.

#16 - 2015-05-22 01:25 AM - Giovanni Manghi

- Status changed from Feedback to Closed

- Resolution set to fixed/implemented

fixed in master.

#17 - 2015-05-22 01:42 AM - Giovanni Manghi

- Status changed from Closed to Reopened

- Resolution deleted (fixed/implemented)

Martin Dobias wrote:

| *The problem is most likely the same as #12406 - please try again with the latest master.*

sorry, it is not fixed.

#18 - 2015-05-22 02:41 AM - Stefan Blumentrath

I can second that it is not fixed on OSGeo4W (QGIS e8587c3) on Win 7.

I created a regular grid in two different CRS (25832 and 25833) of 1kmx1km for testing.

With OTF on, the field calculator returns an area of 992xxx meter, with OTF off the result is correctly: 1000000m²

The same applies for perimeter, which has a little imprecision when OTF is on (4001.x m instead of 4000m).

The derived area in the "Identify results" is 0.0000 m² when OTF is on, while it is correct and precise (100.0 ha) when OTF is off.

The derived perimeter is identical with values from field calculator (4001m).

The distance measure tool lacks precision too. It measures the width of the 1000m grid to be 1000.325 m when OTF is on, while it returns 1000.0 m when OTF is off. The same applies for the area measure tool (99.4 ha, when OTF is on, 100.0 ha when OTF is off).

All this applies for both grids and independent from Project CRS to be 25833 or 25832.

this build does not yet includes the probable fix. I have also tested the same build... need to wait for the next nightly build or compile myself.

#20 - 2015-05-24 03:51 AM - Stefan Blumentrath

The problem is still present in QGIS code revision 2ff6f72 (Installed through OSGeo4W, 32bit, Win 7).

However, "Identify results" does no longer return 0.0000 m2 for my 1km vector grid cells, but (wrongly) 99.4 ha when OTF is on. Results between "Identify", and "Measure tool" and "Field calculator" seem to be identical now...

#21 - 2015-05-24 03:59 AM - Giovanni Manghi

what ellipsoid are you using? is defined in project properties. If you set it to "none/planar" the the returned area is 1sqkm, otherwise is slightly different, but right and therefore this issue (and probably the many others related) is fixed.

#22 - 2015-05-26 12:58 AM - Stefan Blumentrath

It is indeed as you describe. Measurements are accurate when I set the ellipsoid back to "none/planar". However, the ellipsoid - in my case "GRS 1980" (which is the ellipsoid of the CRS I use (EPSG:25832)) is set auto-magically by QGIS when OTF is activated. IMHO, QGIS should not define the ellipsoid, if that was not appropriate...

Please note, that measurements in QGIS (2ff6f72) also differ between OTF on / off, when project CRS and layer CRS are identical. Meaning a polygon of 1 km2 in 25832, is not 1 km2 (but 99.3 ha) when "reprojected" OTF to 25832 (defined as project CRS). Maybe I lack some basic knowledge in geodetics here... Why should the area differ in this case differ only because OTF is on?

In comparison OTF in PostGIS gives no difference in area when a geometry is reprojected to it's source CRS: For a vector grid in 25832 $ST_Area(geom) = ST_Area(ST_Transform(geom, 25832))$ --> True.

#23 - 2015-05-26 01:09 PM - Giovanni Manghi

IMHO, QGIS should not define the ellipsoid, if that was not appropriate...

the ellipsoid is set to the one of the project CRS, seems a reasonable choice to me.

Please note, that measurements in QGIS (2ff6f72) also differ between OTF on / off, when project CRS and layer CRS are identical. Meaning a polygon of 1 km2 in 25832, is not 1 km2 (but 99.3 ha) when "reprojected" OTF to 25832 (defined as project CRS). Maybe I lack some basic knowledge in geodetics here... I cannot see this difference. Can you attach sample data?

#24 - 2015-05-26 02:39 PM - Stefan Blumentrath

- Status changed from Closed to Reopened
- File sqkm_grid_epsg_25832.sqlite added
- Target version changed from Version 2.10 to Future Release - High Priority

Please find attached an SQLite DB for testing. It contains one 1km2 grid cell in EPSG 25832. In the attribute table I compared area measures of PostGIS and QGIS when re-projecting OTF to:

EPSG 25832 (same as layer)

EPSG 25833 neighboring UTM zone, same ellipsoid

EPSG 3410 an arbitrary chosen, completely different CRS.

In all cases CRS of the source layer is EPSG 25832.

CRS;Area PostGIS;Area QGIS

No OTF;1000000;1000000

OTF to 25832;1000000;990073.641680859

OTF to 25833;996081.791878303;990073.641680859

OTF to 3410;991263.3653474;1000000

Strange enough, I got exactly the same results with different CRS / UTM zones, when OTF-reprojection to the same ellipsoid. I double-checked that with e.g. 25836, and this behavior is the same there too. Reprojecting to a completely different CRS resulted in an area of exactly 1km2, which seems a bit odd.

#25 - 2015-05-27 12:29 AM - Giovanni Manghi

There is something wrong with the data you used to make this test. In fact when I add the layer to QGIS it says that the CRS is not recognized and that it sets to WGS84. In your case you may have QGIS configured to automatically give the layers another CRS, maybe 25832, so you may have the feeling that your input is in 25832 but is not.

I attach here a shapefile that is originally in 25832, and made the same tests you made, the results are consistent to me.

Anyway if you really find something is still wrong with area computation then better open a new ticket. The main issue seems solved (the completely wrong values), if there is still something wrong this is because we need to fine tune how ellipsoid are set with OTR and eventually why there are differences compared to other packages.

I tested measuring the second province from the left, Parma

3 449,766 km² OTF ON (25832)/GRS80

3 447,087 km² OTF OFF

3 447,087 km² OTR ON (25832)/planar

3 447,087 km² OTR ON (25833)/planar

3 447,087 km² OTR ON (3410)/planar

#26 - 2015-05-27 01:30 AM - Stefan Blumentrath

With your data I get the same results as you. Yet, it seems that measurement results are in principle not different from what my test data ended up with. I am struggling with understanding why it should be considered OK that results differ between "OTF ON (25832)/GRS80" (which is the layer CRS) and "OTF OFF" by more than 2 km²? And should not area differ when measured using different CRSes?

Is a new ticket (yet another related) worth the extra work (this ticket is after all named "Computed area is wrong when reprojection is active"), and to me this still seems to be the case? I would consider 2km² more than rounding imprecision...

BTW. when I choose a CRS for OTF which is based on the same ellipsoid as source layer, the ellipsoid for measuring is set to the one of the CRS of the layer. If the ellipsoid differs between data and project, the ellipsoid for measurement is automatically set to none/planar.

Just as a side note: Data were produced with QGIS (Vector -> Research tools -> Vector grid) while in a project with CRS defined as 25832 (OTF off) and they ended up where expected. So they should be in 25832, even if CRS is not saved in the SQLite DB I attached. When I had them in PostGIS they were treated as 25832 any way, and area measurements were accurate there...

#27 - 2015-05-27 01:53 AM - Giovanni Manghi

Stefan Blumentrath wrote:

I am struggling with understanding why it should be considered OK that results differ between "OTF ON (25832)/GRS80" (which is the layer CRS) and "OTF OFF" by more than 2 km²?

because the area computed on a plane and computed on a curved surface are different, the latter being bigger of course.

And should not area differ when measured using different CRSes?

if you don't use an ellipsoid then you computing on a plane... and on a plane a square meter is always a square meter...

#28 - 2015-06-04 11:18 PM - Stefan Blumentrath

According to <http://www.statistica.parma.it/>, the area of the Province of Parma is 3.447,48 km². That means either the Italian test data is quite imprecise or the measurement in QGIS is quite a bit off when OTF is on (and the default measurement ellipsoid is used). While results are closer to the official numbers when OTF is off or the measurement ellipsoid is manually set to None / Planimetric ...

Now I also tested with data in geographic CRS (latlon/EPSSG:4326), more precisely a 1 x 1 degree "square" (~ Polygon(0 0, 0 1, 1 1, 1 0, 0 0)).

Measurement with **OTF on**, with a geographic CRS defined for the project (**EPSSG: 4326**, Measurement ellipsoid: **default (WGS84)**) leads to results in a reasonable dimension (**12 512.965 km²**).

Measurement with **OTF on**, with a geographic CRS defined for the project (**EPSSG: 4326**, Measurement ellipsoid: **manually set to None / Planimetric**) leads to results in a reasonable dimension (**12 429.846 km²**, but different from Measurement ellipsoid WGS84).

Measurement with **OTF off**, with a geographic CRS defined for the project (**EPSSG: 4326**, Measurement ellipsoid: **default (None / Planimetric)**) leads to results in a reasonable dimension (**12 429.846 km²**, but different from results when project CRS is 25832).

Measurement with **OTF on**, with a projected CRS defined for the project (**EPSSG: 25832**, Measurement ellipsoid: **default (GRS1980)**) leads to results in a reasonable dimension (**12 512.965 km²**).

Measurement with **OTF on**, with a geographic CRS defined for the project (**EPSSG: 4326**, Measurement ellipsoid: **manually set to None / Planimetric**) leads to results in a reasonable dimension (**12 429.846 km²**).

Measurement with **OTF off**, with a projected CRS defined for the project (**EPSSG: 25832**, Measurement ellipsoid: **default (None / Planimetric)**) leads to unreasonable results because data is treated as XY (**1 m², perimeter of 4m**).

If the area computed on a curved surface was supposed to be bigger than the area computed on a plane (as you wrote), then the measurements I made in QGIS with "OTF on" using the 1km² vector grid earlier are not correct either because area was smaller when computed on ellipsoid.

Maybe you are willing to help me one last time to understand what is going on here.

OTF does not re-project the data/layer to the CRS defined for the project before measurement. Otherwise, results would (must) be different when different project CRS are used, right? And results should be identical - comparing OTF on / off - when layer CRS and project CRS are identical. Both is not the case.

Neither does it "only" apply the measurement ellipsoid defined in the project to the data/layer. In this case measurements would (must) be identical when the ellipsoid of the layer CRS and the measurement ellipsoid are identical, shouldn't they? This is not the case either.

Furthermore, setting the ellipsoid for measurement to "None / Planimetric", does not treat data as XY, otherwise my 1 degree vector grid should result in an area of 1 square unit, regardless project CRS.

And finally, switching OTF off does not mean that data is treated as XY either, at least this not the case when the project CRS is geographic. However, it seems to be the case when project CRS is projected.

So, the question is: How is OTF supposed to affect measurements?

Do you really consider this bug properly fixed so the ticket can be closed? It seems that I am not the only one who is uncomfortable with the current measurement behavior:

<http://osgeo-org.1560.x6.nabble.com/QGIS-2-8-2-no-values-calculating-area-with-Export-Add-Geometry-Columns-on-Ellipsoid-tt5208252.html#a5208298>).

Again, this is the probably most used and most essential GIS functionality. In 2.8.2 it leads to obviously wrong data (Area = 0.0m when OTF is on). I would actually prefer that over the slightly wrong data, because users can see the error immediately...

Maybe a simple means of improving the situation is making the measurement ellipsoid "None / Planimetric" the default also when OTF is on?

#29 - 2015-06-07 04:25 AM - Giovanni Manghi

Stefan Blumentrath wrote:

we don't really know how/when and using what input data this value was computed, so it is not really useful in the analysis to try understand if qgis does the right thing.

I will try to answer the rest as soon as I can. Cheers.

#30 - 2015-06-07 10:17 AM - Stefan Blumentrath

BTW, SAGA gives for your Parma-polygon also 3 447,087 km2. I can compare other tools too if that is of relevance...

#31 - 2015-06-08 04:59 AM - Giovanni Manghi

Stefan Blumentrath wrote:

BTW, SAGA gives for your Parma-polygon also 3 447,087 km2. I can compare other tools too if that is of relevance...

this is a good news, isn't it? :)

of course comparing with as many other gis packages is good. If you can, it would be very appreciated.

#32 - 2015-06-08 05:02 AM - Giovanni Manghi

Do you really consider this bug properly fixed so the ticket can be closed? It seems that I am not the only one who is uncomfortable with the current measurement behavior:

<http://osgeo-org.1560.x6.nabble.com/QGIS-2-8-2-no-values-calculating-area-with-Export-Add-Geometry-Columns-on-Ellipsoid-tt5208252.html#a528298>.

this thread is about the situation before the proposed (and committed) fix, so it isn't really pertinent, not anymore at least.

Again, this is the probably most used and most essential GIS functionality. In 2.8.2 it leads to obviously wrong data (Area = 0.0m when OTF is on). I would actually prefer that over the slightly wrong data, because users can see the error immediately.

I personally don't agree, but this doesn't count much. Anyway from the test I have made I was (and still am) pretty confident that things are ok now.

Maybe a simple means of improving the situation is making the measurement ellipsoid "None / Planimetric" the default also when OTF is on?

Why choosing to have by default a less precise measurement when you can have a more precise one?

#33 - 2015-06-08 05:03 AM - Giovanni Manghi

| *So, the question is: How is OTF supposed to affect measurements?*

I'll be back on this a little later. Cheers.

#34 - 2015-06-08 05:51 AM - Stefan Blumentrath

GRASS 6.4.4 gives also 3 447,087 km² for the Parma-Polygon.

That is good news for those who turn off OTF or manually set the ellipsoid to None/Planimetric (because they will get this value too).

Those who use default settings in QGIS with OTF ON and Measurement ellipsoid GRS80, however, end up with 3 449,766 km² (see your Note 25 in this ticket). I guess they will wonder where the 2 km² come from... Esp. since GRS80 is the ellipsoid both layer and project CRS is based on...

This issue has been discussed also in #3296-11

BTW, Bug #3296 can probably be closed, since measurements are identical between Identify tool and Field calculator (see note 20 in this ticket).

good. Also Arcgis gives the same value with OTF off. Interesting enough ArcGIS disables the area measure tool when OTF is ON.

I don't think really there is nothing wrong. The same area measured on an ellipsoid it usually lead to a bigger value compared to the same measured on a plane. I wrote 'usually' because I was remembered that not all CRSs are conservative for areas, so it can also happen the area value (with OTF on) is lower than the one computed on a plane (OTF off).

Regarding one of the cases in comment 28

"Measurement with OTF off, with a projected CRS defined for the project (EPSG: 25832, Measurement ellipsoid: default (None / Planimetric)) leads to unreasonable results because data is treated as XY (1 m², perimeter of 4m)."

this does not make sense at all (mixing a layer with a geographic CRS and nother with a projected one and OTF off): with OTF off you elect to use the units defined in the project properties. If you have meters then is normal that the layer with the geographic CRS will be measured in meters. But again, it is not a case that make much sense.

The point here was mainly to systematically check the behavior with the all possible combinations of relevant variables. Nevertheless, this behavior is addressed in #10799.

Summing up, at least GRASS, SAGA, and ArcGIS (and likely also PostGIS) calculate 3 447,087 km² for Parma (using cartesian maths / planimetric measure by default, resulting in numbers coherent with official statistics). Up to now, only QGIS is reported to measure 3 449,766 km² for Parma (using an ellipsoidal / geodesic area measure as the default).

So, I think we can conclude that the area calculation may give the correct ellipsoidal area, but that ellipsoidal area is at least very unusual.

I do not have the knowledge to judge if ellipsoidal area calculation is generally more accurate compared to planimetric area calculation (assuming the chosen PCS is appropriate for the data and purpose) and I could not find a reference on that on the internet (a pointer would be appreciated). However, if I understood correctly, the code for area measurement in QGIS is copied from GRASS. With my amateur perspective I would assume the GRASS-devs have a good reason for sticking to planimetric calculations, given that they have the ellipsoidal measure in their code base (for quite some years now)... According to the documentation (<http://help.arcgis.com/en/arcgisdesktop/10.0/help/index.html#//00s500000022000000>) ArcGIS always calculates area planar (and geodesic measurements are only available for distances)...

Closing, - thanks to your explanations - it seems now OK for me too, to close this ticket. So, sorry for the noise.

Yet, I think it would be important that the Documentation is explicit about the fact that the default area (and distance) measurements in QGIS disregard both Project and Layer CRS (using only the ellipsoid from the Project CRS by default), esp. given that this behavior is different from all other tested GIS. The lack of documentation here is probably the reason why the measurements often are perceived as inaccurate or wrong?!

In addition, I could imagine posting a question on the UX-mailing list regarding the favored behavior of QGIS with OTF on/off (here also other, related usability issues could kick in: e.g. <http://osgeo-org.1560.x6.nabble.com/Changing-project-crs-td4940240.html> or #10799)... After that a new ticket might be filed depending on user feedback? What do you think?

#37 - 2015-10-10 06:45 AM - Randal Hale

So I just tested this under 2.11 master.

As of right now if I perform an area calculation in 2.11 master with EPSG:2240 the area comes out to be 0 (actually a very very small number). If I turn OTF off - it's right (I'm doing \$area/43560 to get acres). Do I need to explain to clients that OTF needs to be off for area calculations?

#38 - 2015-10-13 03:40 PM - Stefan Blumentrath

- *Status changed from Closed to Reopened*

- *Target version changed from Future Release - High Priority to Version 2.12*

Taking the liberty to reopen this ticket as the issue pops up again (see also: #13209). It was prioritized as blocker here, while it is not in the newer ticket. Maybe this is really an issue for a unit test, as Matthias Kuhn indicated, given the long history? Area measurement is a basic and central functionality of any GIS!

#39 - 2015-10-15 12:48 AM - Nyal Dawson

- *Status changed from Reopened to Feedback*

Please test with current master, this may have been fixed with #13601

#40 - 2015-10-16 09:35 PM - Nyall Dawson

- Status changed from *Feedback* to *Closed*

Reclosing - there's nothing new here, discussion can continue in #13209. Note that the fix for #13601 introduced some extra unit tests for this issue.
