Easy fix?:	No		**Copied to github as #:**	20448

Description

With QGIS 2.8 nested rules look great in layer tree.
I wonder if it is possible to bring up symbol definition window of the clicked symbol instead of opening Style tab in Layer Properties window?
When I want to fine-tune the current symbol, I have to open Layer Properties - Style and scroll through all rules of my style to find the symbol once again and open up it's properties. It takes time if you have a lot of rules in the style. It would be a lot easier if I could just bring up symbol definition by clicking on it in a layer tree.
