Easy fix?:	No	
<div>Description</div> <div>Hi !  In raster layers, we are able to either define the min/max either manually or from the data (with quite precise control allowing to ignore outstanding values). The exact same feature should be available for graduated style for vector layers.  Then, one should also be able to choose whether he wants to clip features that are outside the defined range or to show include them in the lowest/highest class, again exactly like how you can do for raster layers.  For the sake of consistency, the UI should be the same between rasters and vectors (probably improving a bit the UI at the same time, since for now it's not very clear).  What do you think ?  Best,  Olivier</div>
