

QGIS Application - Bug report #12649

inconsistencies in editing tools when working on a postgis layer without primary key

2015-04-26 02:43 PM - Giovanni Manghi

Status:	Closed	
Priority:	Normal	
Assignee:		
Category:	Digitising	
Affected QGIS version:	master	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:		Resolution: end of life
Crashes QGIS or corrupts data:		Copied to github as #: 20762
Description		
Not sure if this is a regression.		
Add a postgis layer without primary.		
Toggling editing is possible but:		
<ul style="list-style-type: none">- only the "add feature" tool is active. New feature can be added and the layer can be saved by toggling editing (the "save edits" tool is disabled as it is the node tool, the "move features" tool, the "delete selected" and the "cut features" ones).- in the advanced digitizing toolbar the only active tools are simplify, reshape, split and merge selected, but none of them as any effect.

Do you have an idea how to modify (send an update to the db) an existing feature without a primary key?

Hi,

Matthias Kuhn wrote:

no I don't. Anyway I'm not sure why you asked. This ticket is just about the fact that in this cases qgis gui/tools are not consistent. If there is any intrinsic limitation about editing such layers then all the editing tools should be disabled. On the other hand if there are no particular limitations then editing tools should be enabled.

#3 - 2015-04-30 12:02 AM - Matthias Kuhn

I asked because it's the foundation for the decision if the tools should be enabled or not :)

In this case I agree that all editing tools except for adding features should be disabled.
