

QGIS Application - Bug report #12669

Could not snap to a segment on the current layer

2015-04-29 02:20 AM - Sandro Santilli

Status:	Closed	
Priority:	Normal	
Assignee:		
Category:	Digitising	
Affected QGIS version:	2.8.1	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:	No	Resolution: end of life
Crashes QGIS or corrupts data:	No	Copied to github as #: 20776
Description		
<p>I'm getting the error "Could not snap to a segment on the current layer" when trying to select a POINT feature in a POINT layer fetched from PostGIS with the node tool in edit mode.</p> <p>The "Snapping options" are "Snap to: Off", "Snapping mode: all layers", "Tolerance: 0 map units".</p> <p>There is a single layer in the map.</p> <p>The error only happens on a subset of the points. I think those points were not there when the layer was initially loaded, and they probably fall outside of the original layer extent, although "Zoom to layer" includes them.</p> <p>Saving the project and re-opening it does fix the issue, which seems to confirm the problem being with those points not being present initially.</p> <p>I see a few of bugs:</p> <ol style="list-style-type: none">1. Snapping is attempted while not requested by options2. Snapping to "segment" is attempted when the layer is a point layer ?3. New features are not visible by the snapper <p>This is with current 2.8 branch (pre 2.8.2).</p> <p>I hadn't tried at reproducing it from scratch but I think it involves dropping and re-creating the PostGIS table after it was loaded as a layer, and adding new off-extent points to that table.</p>
