

QGIS Application - Bug report #12795

Georeferencer generates incorrect GDAL script when input file is JPG

2015-05-21 01:43 AM - Casper Børgesen

Status:	Closed	
Priority:	Normal	
Assignee:		
Category:	C++ plugins/Georeferencer	
Affected QGIS version:	2.8.5	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:	No	Resolution: end of life
Crashes QGIS or corrupts data:	No	Copied to github as #: 20891
Description		
<p>Problem:</p> <p>When georeferencing a <i>JPEG</i> image QGIS return telling the transformation could not be made.</p> <p>Why:</p> <p>According to the <i>GDAL script</i> QGIS can generate, the process is split into two steps:</p> <ol style="list-style-type: none">gdal_translategdalwarp <p>Script:</p> <pre>gdal_translate -of GTiff -gcp ... -gcp ... "original.jpg" "temp.jpg" gdalwarp -r near -tps -co COMPRESS=LZW -dstalpha "temp.jpg" "result.tif"</pre> <p>The input and output argument provided to gdal_translate is both with <i>JPG</i> extension, while the -of argument is GTiff. gdalwarp cannot handle a GeoTIFF image with JPG extension.</p> <p>Solution:</p> <p>So either should the first process set the -of argument to JPEG (in this instance) or change the output extension to <i>TIF</i>.</p>

I can't reproduce - is this only when using the generated GDAL scripts? Does the georeferencing work OK from within QGIS itself?

I reported this problem because my users couldn't use QGIS directly and I had to create a batch script to solve the problem. Thats why I discovered the JPEG/TIFF problem.

I have a rather large (30MB) JPEG image and when I use QGIS to georeference it, I get the error "Failed to compute GCP transform. Transform is not solvable.". When I correct the JPEG/TIFF problem in the corresponding GDAL script generated by QGIS, the same transform succeeds. That's why I thought the problem indeed was the extension.

I have just tried though with a small JPEG image and QGIS was able to transform it. I have tried both in QGIS f4c3f3d (latest weekly for windows).

Could this be image size related somehow?

So... to clarify, there's two issues. One is that the generated GDAL script is wrong, the second is that QGIS can't transform your file. Can you open a second issue for the failing to transform issue, and attach a link to the data and GCP points file?
