Pull Request or Patch supplied:

Easy fix?: No Copied to github as #: 21238

Description

When one join a non-spatial table to attribute table it is possible to run a selection of features by expression using the fields of the non-spatial table, but it is not possible to run a query using the fields of the non-spatial table, unless the layer is saved with a new name. I suggest to enable queries using the fields of the non-spatial table without save the layer.
