QGIS Application - Bug report #14139 Error inserting feature in WFS-T server

2016-01-19 02:47 AM - Ivano Brunet

Status: Closed Priority: High

Assignee:

Category: Unknown

Affected QGIS version:Regression?:NoOperating System:Easy fix?:No

Pull Request or Patch supplied: Resolution:

Crashes QGIS or corrupts data: Copied to github as #: 22141

Description

Cannot insert a new feature composed by a single polygon/linestring into a geoserver multipolygon/multilinestring WFS-t layer.

It raises an error:

Could not commit changes to layer xxx:yyy

Errors: ERROR: 1 feature(s) not added.

Provider errors:

unsuccessful service response: Error performing insert: java.lang.String cannot be cast to com.vividsolutions.jts.geom.Geometry

But if create two polygon/linestring and merging them into a single feature, the insert works.

It seems QGis send a gml multypoligon feature if there is more than a polygon, a polygon feature otherwise, while geoserver needs a strictly corresponding feature type with that defined on the layer.

I think the correct behavior was to send a multi feature with a single polygon/linestring if the wfs layer is a multipolygon/multilinestring.

Yes, there is only one way to do it right and it is to respect the schema of the feature type. For example the schema of "topp:states" feature type can be checked with

 $\underline{\text{http://demo.opengeo.org/geoserver/wfs?service=wfs\&\#38;version=1.0.0\&\#38;request=describefeaturetype\&\#38;typename=topp:states}$

Result contains

<xsd:element maxOccurs="1" minOccurs="0" name="the_geom" nillable="true" type="gml:MultiPolygonPropertyType"/> which means that WFS client must use either an empty geometry or or a MultiPolygon geometry in WFS transactions.
