select features in a spatialite view leads to wrong_results

When I select features in a spatialite view, wrong objects are selected.

Sample jpgs are attached.
I'm trying in QGIS 2.14 to select a field (without pkey) and then I see the same prob again.

Is it obligatory to have a pkey in a spatialite table?

Actually, I'm now using a table create based on a view

Backported to 2.14 branch in commit:780c5873f62cf60d040e776f622bc1ad4edb7e79

The same problem is present in 2.18.13 when adding a spatialite layer through DB MANAGER -SQL Query.

Easy to replicate: DB Manager => SQLITE => SQL window => Select * from your_layer => add layer.

Feature selection will be wrong again.

The same problem is present in 2.18.13 when adding a spatialite layer through DB MANAGER -SQL Query.

Easy to replicate: DB Manager => SQLITE => SQL window => Select * from your_layer => add layer.

Feature selection will be wrong again.
