QGIS Application - Bug report #14512
Avoid creating of corruption Shapefiles during Editing/saving.

2016-03-16 06:20 AM - sarra sahbani

Status:	Closed			
Priority:	High			
Assignee:				
Category:	Unknown			
Affected QGIS version:	2.14.0	**Regression?:**	No	
Operating System:		**Easy fix?:**	No	
Pull Request or Patch supplied:	No	**Resolution:**	not reproducable	
Crashes QGIS or corrupts data:	Yes	**Copied to github as #:**	22485	

Description

when digitizing some features (lines/polygons) in QGIS 2.14.0 in shapefile format, and after saving the changes, the current dbf (or in another case the shx and shp) file(s) seemed to have been created with the '_packed' attached to the end.
This problem happned frequently.

If the dbf file was renamed, we can't restaure the previous state of the shapes.

When does this happen exactly? Do you have a reproducible way?

when I digitize many features, or I delete some of them then I save, this problem happened.

hope this is not #11007 nightmare all over...

Do you have a specific series of steps we can use to replicate the issue? Thanks in advance.

it is not #11007 apparently and fortunately (I tested and I confirm is fixed, at least with those steps), anyway there are relates of issues editing shapfiles, but none of them seems to have appropriate steps to replicate, that make troubleshooting very hard.

Please reopen if you find those steps (and meanwhile install the latest version available and try disable all 3rd party plugins).
