**Description**

Steps to reproduce:
1. Make sure that the attribute table opens as a floatable dock panel (it might require a QGIS restart)
2. Create a new project
3. Add a vector layer
4. Right-click on the layer, open the attribute table
5. The attribute table should be docked to the bottom part of the window
6. Click on the panel's [x] close button
7. **boom** crash.

The gdb's where output:

```

Note: you might have to open and close the attribute table panel twice to trigger the crash. On my machine, it crashes either on first or second closure.

If I disable TimeManager, crash is gone, closing.

I was wrong, the crasher is still occurring even when timemanager (and other plugins) are disabled.

Nathan can reproduce the crasher.

I've installed Qt's debug package, here's a more complete gdb output of the crasher:

- Category changed from Attribute table to Map Canvas

Still crashing; updated gdb trace:

```
#0 QRegion::operator= (this=0xb2abf98, r=...) at painting/qregion.cpp:3935
```
I've investigated this and identified more precisely the cause of the crash.

The Valgrind log shows it is a double free issue:

If the widget is not created, or updateActionImage() not called, then there's no crash.

Alternatively, if you keep that code but change QgsAttributeTableView::createActionWidget() so that the toolButton = new QToolButton( this ) and container = new QWidget( this ) use nullptr instead of this as a parent, there's no crash (but the painting of the icon is corrupted).

So there's an ownership issue with the backing store of this widget...

#8 - 2016-06-13 09:33 PM - Mathieu Pellerin - nIRV
- File crash.mp4 added

I noticed a larger OGR dataset will do a better job at replicating the crash quicker (i.e., you won't need to open -> close -> open -> close -> etc. for long).

See attached video.
