All versions QGIS above 1.8.0 send WMS request to server without BBOX params. This situation is when I add WMS layer with coordination system the same like project coordination system. In my case it was project coordination system EPSG:2176. When I add WMS layer with different coordination system (for example EPSG:2180) I can show this but unsatisfaction quality (transformation). After checking it turned out, that WMS requests are incomplete. Attachment include requesting logs.
