

QGIS Application - Feature request #15221

Digitizing: Add a tool to toggle editing all/selected layers

2016-07-04 09:27 PM - Harrissou Santanna

Status:	Open	Resolution: Copied to github as #: 23158
Priority:	Normal	
Assignee:		
Category:	Digitising	
Pull Request or Patch supplied:		
Easy fix?:	No	
Description		
<p>When you have many layers in edit mode, it's handy in two clicks to have all of them saved through the "Current Edits" combo box --> Save for All/Selected layers.</p> <p>Once done, one still needs to put out of edit mode one by one all the edited layers. Could be nice to have a tool that does this in two clicks too.</p>

For PostgreSQL this is already available, if you enable it:

See Project --> Project Properties --> Automatically Create Transaction groups where possible

This adds all PostgreSQL/Postgis layers from the same connection into edit mode at once.

It has other side-effect, too, though.

Yes Andreas I'm aware of this option. Note that this option saves/rollbacks also the modifications in those layers.

What I was requesting is a tool that simply puts layers (regardless their provider) in (or out of) edit mode without clicking them one by one.
