<b>Crashes QGIS or corrupts data:</b>	No	<b>Copied to github as #:</b> 23486
<b>Description</b>  When copying features between spatialite layers, QGIS does not preserve z coordinate if the source and destination layer is multipart. Also, identification tool does not show Z coordinate when identifying multipart features as well as function z in field calculator cannot calculate z dimension for multipart features. All of the above works well with single part layers.  QGIS master, installed on Windows 10.
