Easy fix?:	No	**Copied to github as #:**	23731

Description

For now QGIS Server returns GetLegendGraphic in jpeg or png formats. That's not great when using it in responsive webapps:

1. Screen resolutions differ and raster response doesn't scale well.

2. Can't use raster text well in html elements.

3. You have to issue a request for each layer if you want to get legend for each one separately. That's not great when you have a lot of layers in your project.

MapServer has implementation of SVG output, not sure about GeoServer. Could be great to have it in QGIS.
