

QGIS Application - Feature request #16075

Introduce a "search\_feature" widget based on attribute or location

2017-01-13 08:57 AM - Regis Haubourg

<b>Easy fix?:</b>	No	
<b>Description</b>		
<p>One first usage would be to allow to easily find a related feature in relation reference widget, when currently it is either a huge dropdown list or a click on the map tool.</p> <p>The button could be used in a broader perspective (i.e. not only for the relation reference widget) and introduce a new "search feature(s)" widget that allows for searching features based on attributes or location. This widget would be opened with a separate button (like the select from canvas button now).</p> <p>The combobox on the other hand shouldn't load all the options (if there are more than ~100 there is no longer any point in doing so) but have an autocompleter that works with requests on the data source and proposes matches based on this.</p>
