

QGIS Application - Bug report #16134

identify features' highlight missing on graduated renderer using expression-based column

2017-01-30 07:19 PM - Mathieu Pellerin - nIRV

Status:	Feedback	
Priority:	Normal

Affected QGIS version:	master	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:		Resolution:
Crashes QGIS or corrupts data:		Copied to github as #: 24046
Description Here's an interesting one: when a vector layer's renderer is set to graduated, and its graduation column is an expression, the identify features' semi-transparent red highlight (to identify which feature(s) is overlapping with the canvas mouse click) is missing. It's not the end of the world, but it's rather perplexing when you don't know what's going on. Steps to reproduce <ol style="list-style-type: none">1. Open the attached id_highlight_gone test project2. Select the Identify Feature tool3. Click on one of the polygons4. Notice that while the polygon clicked is correctly returned in the identify feature panel, there is no semi-transparent red polygon overlay on the canvas5. Open the style dock, and switch the layer's graduated renderer to rule-based (rules will be automatically transferred over)6. Return to the canvas with the Identify Feature tool, and click on one of the polygons7. notice the semi-transparent red polygon overlay is there
