

QGIS Application - Bug report #16138

Error executing algorithm Merge lines

2017-01-31 12:21 PM - Pieter Brusselman

Status: Closed	
Priority: High	
Assignee:	
Category: Unknown	
Affected QGIS version: 2.18.2	Regression?: No
Operating System:	Easy fix?: No
Pull Request or Patch supplied:	Resolution:
Crashes QGIS or corrupts data:	Copied to github as #: 24050

Description

When merging layers I get following message:

Error executing algorithm Merge lines{} field in layer {} has different data type than in other layers.

What am I doing:

I have some line-layers and some polygon-layers. I buffer the line-layers with a fixed distance buffer so I get all polygon-layers. Each polygon-layer is converted to lines. When merging all converted layers I get that message.

I tried to eliminate the layers who are responsible for the error. I found two. One was originally a line-layer that I buffered, the other was originally a polygon-layer. So I can't figure out if the bug is due to the buffering or not...

History

Apparently, if i merge all those layers 'by hand' outside a model, it works... Very, very strange behaviour
