Crashes QGIS or corrupts data:	Copied to github as #: 24647

Description

Hello QGIS Community,

I have a project with an atlas based on a layer with several entities and attributes.

In my composer I have a A4 sheet with a map and an attribute table one above the other.

The values of the attribute table change on each page (check only show features ...).

I have defined the anchor for the position of my attribute table at the top right and have fixed the value (I have edit the value with the expression builder and enter 208 (for an A4 sheet)).

In theory, for all pages of my atlas, the top right corner of the attribute table will be at the X position of : 208 mm, or it is not the case during the preview of the atlas and in it export.

On the preview, when the attribute table is not well placed, if I click on the 'Refresh the view' button, things go in order.
