QGIS Application - Bug report #16852
layer actions triggered from identify + right click do not have variables populated (@click_x and others)

2017-07-12 10:55 AM - Regis Haubourg

Crashes QGIS or corrupts data:		**Copied to github as #:**	24751

Description

Hi,
I discovered this regression in 2.18.10.

How to reproduce:

- add the default actions to a layer
- identify + right clic on the layer
- execute the "display clic coordinate" action
-> coordinates displayed are empty

Here this breaks production applications.

PS: in qgis 3.0, the actions list on right clic of identify has totally disappeared. Is that on purpose ?

Hi Regis, this worked in 2.18.9? If yes then regression within the 2.18 release are really start to pile up... being the 2.18.10 a release with many of them...

I have been trying to find any commit related for one hour and didn't anything clear recently (since october!)

It is a regression for sure, but git bisect with QGIS compile time is not an option. Better go to a fix and a unit test quickly.

I think I'll have some funds for fixing that. I take the action .
