Description

I use the latest version of QGis 2.18.12 on Windows 7.

From a Spatialite layer of 85218 entities, I made a virtual layer of 714 entities.

When I view it or when I open the attribute table for this virtual layer no problem the same when I identify entities.

When I make a selection with a rectangle I find in the attributes table the selected entities.

But if from the attribute table I make a copy from the menu bar and then Edit-> Paste entities as a temporary layer this one does not contain at all the selected entities

The problem occure only with virtual layer

Same problem as Bug report # 14736
