

QGIS Application - Bug report #17658

Digitizing: Ctrl+Z (and other cancelation tools) reset the features to its initial state (or at least more than one action).

2017-12-08 03:33 PM - Harrissou Santanna

Status:	Closed	
Priority:	High	
Assignee:	Nyall Dawson	
Category:	Digitising	
Affected QGIS version:	master	Regression?: Yes
Operating System:		Easy fix?: No
Pull Request or Patch supplied:	No	Resolution: fixed/implemented
Crashes QGIS or corrupts data:	Yes	Copied to github as #: 25555
Description		
<p>I'm doing some digitizing on a geopackage layer</p> <p>And it looks like when hitting ctrl-Z, it reverts more than the last action. At the same time, the Undo/Redo panel just jumps one action above (hence not coherent with the state of actions)</p> <p>To reproduce, take a feature and open the undo/redo panel, select the node tool</p> <p>Move a point</p> <p>delete a point</p> <p>move another point or group of points</p> <p>delete a point</p> <p>press ctrl z.</p> <p>Here, it brings the feature to its original state (not just one action reverted as it should be). The same thing happens when you click ANY row in the undo panel</p> <p>Another interesting part is what happens at the same time in that panel:</p> <p>1/When you press Ctrl+Z, the focus in the panel jumped one step back despite the state of the feature being reset. But actually, if you have clicked ANY row in the Undo panel to revert your action(s), it would have reverted all the actions too</p> <p>2/if you click on the previous actions in the Undo panel, you'll notice that nothing happens</p> <p>3/If you click on a more recent action than in step 2, then you'll redo your latest actions.</p> <p>It looks like there's something messy with cancelation steps.</p> <p>I checked the "Corrupts data" status because if you don't have whole feature in front of you, you may not notice reversion of some changes.</p>
