QGIS Application - Bug report #1766
Installer skips all files and completes without installing anything

2009-07-10 08:33 PM - arvydar -

Status:	Closed			
Priority:	Low			
Assignee:	nobody -			
Category:	Build/Install			
Affected QGIS version:		**Regression?:**	No	
Operating System:	Debian	**Easy fix?:**	No	
Pull Request or Patch supplied:		**Resolution:**	worksforme	
Crashes QGIS or corrupts data:		**Copied to github as #:**	11826	

Description

I have tried several times to install the Windows version of QGIS on a Windows Vista partition of a Macbook running bootcamp that already has QGIS Mac version installed on the mac partition. Windows sees the Windows partition as the "C:" drive and selects "Program Files" as the install directory. The installation appears to go normally untill it shows "Skipped: " and scrolls past all the files before saying "Quantum GIS 1.0.2 has been installed on your computer"

History

I already seen this behaviour when trying to install on Vista on colleagues pc. If I'm not wrong you have to execute the installer as admin/with admin authorization (or something like that, I don't use nor own Vista).

Please give it a try and report back.

- Resolution set to worksforme

- Status changed from Open to Closed

As supposed you need to run the installer with admin privileges:

right click on the file -> properties -> compatibility -> run this program as administrator

#3 - 2009-07-13 07:09 AM - arvydar -

I only have one account on my Vista partition and it is an administrator account. I did manage to get QGIS installed later using the online installer, so all is good now.

I guess that this doesn't count much: there are still a bunch of applications you need to do the

right click on the file -> properties -> compatibility -> run this program as administrator

in order to be able to install them on Vista.
