<b>Affected QGIS version:</b> 2.18.16	<b>Regression?:</b> Yes
<b>Operating System:</b> Debian 9 (stretch)	<b>Easy fix?:</b> No
<b>Pull Request or Patch supplied:</b> No	<b>Resolution:</b> fixed/implemented
<b>Crashes QGIS or corrupts data:</b> Yes	<b>Copied to github as #:</b> 25921

### Description

Hi,

Qgis crash on right click "save as...".

To reproduce bug:

1. open qgis
2. load layer (I've test whit shapefile, postgresql layer, csv file)
3. right-click on layer
4. click on "save as.."

Qgis crash.

I use Qgis on Debian 64bits (kernel version:4.9.0-5-amd64 ) :

repository: <https://qgis.org/debian> stretch main

revision code: d473c30

A copy/paste on qgis/about:

QGIS version 2.18.16  
QGIS code revision d473c30  
Compiled against Qt 4.8.7  
Running against Qt 4.8.7  
Compiled against GDAL/OGR 2.1.2  
Running against GDAL/OGR 2.1.2  
Compiled against GEOS 3.5.1-CAPI-1.9.1  
Running against GEOS 3.5.1-CAPI-1.9.1 r4246  
PostgreSQL Client Version 9.6.6  
Spatialite Version 4.3.0a  
QWT Version 6.1.2  
PROJ.4 Version 493  
QScintilla2 Version 2.9.3

My first guess would be to start qgis without plugins enabled, or rename your .qgis2 temporarily.

I cannot reproduce here (but I'm on Buster/self compiled 2.18 here).

Information you provided here is not enough to draw conclusions about your situation.

## #2 - 2018-02-03 10:25 PM - Mathieu Denat

Ok, Thanks for feedback.

I test that method monday (office computer) and post results here.

How can i obtain more information from qgis to help you to diagnose problem?

It seem's that there is no verbose mode on qgis precompiled (repository).

Regards.

Hello,

I've tested to remove the .qgis2 directory (in my home) --> No changes.

I've tested to install qgis at my home computer (same Debian version) --> qgis works normally.

I'm perplex.

How can I obtain logs error from qgis, or more informations, to identify problem?

You can read the std output in terminal:

```
qgis
Warning: Object::connect: No such signal QgsMergedBookmarksTableModel::&QgsMergedBookmarksTableModel::selectItem( const
QModelIndex &index )
Warning: Object::connect: (receiver name: 'QgsBookmarksBase')
Warning: QCss::Parser - Failed to load file "/style.qss"
QInotifyFileSystemWatcherEngine::addPaths: inotify_add_watch failed: Aucun fichier ou dossier de ce type
Warning: QFileSystemWatcher: failed to add paths: /home/euziere/.qgis2//project_templates
Warning: QLayout: Attempting to add QLayout "" to QgsPanelWidgetStack "mWidgetStack", which already has a layout
Erreur de segmentation
```

"Erreur de segmentation" translation is "segfault error".

Best regards.

## #4 - 2018-02-06 05:40 PM - Richard Duivenvoorde

Another file which is actually written by Qt4 and remembers the position and sizes of your windows is:

`.config/QGIS/QGIS2.conf`

Maybe try to remove that too? It could have been corrupted maybe?

#### #5 - 2018-02-07 03:19 PM - Mathieu Denat

Well done!

I'll realize that the `QFileSystemWatcher` path seems not correct.

It will be: `/home/MathieuDenat/.qgis2/blablabla`

I test to remove `.config/QGIS/QGIS2.conf` (next week) and come back to you.

Another idea: which package reconfiguring to reset the qgis configuration?

I've do previously:

```
aptitude purge qgis && aptitude install qgis
```

Thanks a lot and have nice day.

#### #6 - 2018-02-08 12:00 PM - Richard Duivenvoorde

I asked around, and I do not think `apt` or `aptitude` should clean up these files from all home directories on a multi-user Linux system?

So my answer would be:

```
rm -rf ~/.config/QGIS/QGIS2.conf
rm -rf ~/.qgis2
```

please close this issue if possible

#### #7 - 2018-02-12 10:36 AM - Mathieu Denat

Hi,

I tried to remove directories from all home directories on all users of system (2 users + root). I launch qgis again and obtain the same error type (segfault error):

```
Warning: Object::connect: No such signal QgsMergedBookmarksTableModel::&QgsMergedBookmarksTableModel::selectItem( const
QModelIndex &index )
Warning: Object::connect: (receiver name: 'QgsBookmarksBase')
Warning: QCss::Parser - Failed to load file "/style.qss"
QInotifyFileSystemWatcherEngine::addPaths: inotify_add_watch failed: Aucun fichier ou dossier de ce type
Warning: QFileSystemWatcher: failed to add paths: /home/MathieuDenat/.qgis2//project_templates
Warning: QLayout: Attempting to add QLayout "" to QgsPanelWidgetStack "mWidgetStack", which already has a layout
Erreur de segmentation
```

This line could be the origin of problem or not?

QInotifyFileSystemWatcherEngine::addPaths: inotify\_add\_watch failed: Aucun fichier ou dossier de ce type. (error translation: file not found)

My bug look like #14781

What can I do?

**#8 - 2018-02-22 08:50 AM - Mathieu Denat**

I'm sorry, but I don't find any solution.  
Have you an idea to resolve problem?

- Status changed from Open to Feedback

| *My bug look like #14781*

| *What can I do?*

of course in both cases it is very likely it is a local issue, as it does not generally happen (in the vast majority of installations). Can you confirm/test on another machine, possibly on a clean install? thanks.

**#10 - 2018-03-20 12:42 PM - Mathieu Denat**

Hi,

You can close de ticket. I make 2 tests:

Test 1:

I've reinstalled Debian from scratch.

Compile GDAL (with ECW support) and install qgis 3 from official repositories.

Test 2:

I test installation of Qgis3.0 on other Debian machine, and all was correct.

So, I don't konw the problem's source, but it's solved.

Thanks at lot for time.
