Description

Please am doing some analysis with my Qgis software and came across an issue which I really wish to know if there is any plugin I can use to solve it faster. I wish to get the closest points to each building I have already selected. That is, I have layer for points (low tension poles) as well as layer for buildings, I selected some buildings which are quite many and wish to get the closest point (pole) to each building I have selected. Please is there any plugin or faster process I can use to solve the issue. Thanks
