

QGIS Application - Bug report #18678

System crash/logout with temp layer in Layers panel

2018-04-10 04:11 AM - Nathan Perry

Status:	Closed	
Priority:	Normal	
Assignee:		
Category:	Map Legend	
Affected QGIS version:	3.0.0	Regression?: Yes
Operating System:	Mac OS 10.13.3	Easy fix?: No
Pull Request or Patch supplied:	No	Resolution: fixed/implemented
Crashes QGIS or corrupts data:	Yes	Copied to github as #: 26566
Description		
<p>When a temporary memory layer is present in the map legend (Layers panel), hovering the mouse over the temp layer's name will cause unexpected system logout. After logging in and re-starting QGIS, closing and re-opening the Layers panel will allow the temp layer to be selected and deleted.</p> <p>The temp layer that causes the crash is generated by the Polygon to Lines algorithm; other temp layers (such as those created by Check Validity) do not cause the crash.</p>

Can't reproduce on Linux - may be another OSX specific issue

I believe there are known issues related to High Sierra and WindowServer crashes, which may be at play here. But the crash is tied to a specific action within QGIS (though I couldn't possibly guess why hovering the cursor over a specific type of layer would cause a crash at the system level).
