

QGIS Application - Feature request #19089
Identify sliver polygons and assign each to the neighboring polygon that shares the same attribute value such as block ID

Easy fix?:	No	
Description		
<p>I know there's a feature in QGIS to eliminate sliver polygons and it can also be implemented in standalone script. It seems like a blackbox to get the results directly. Is there a way in standalone script to identify (extract) sliver polygons in QGIS 3.0? Also, can I use other parameters (e.g. the neighboring polygon that shares the same attribute value such as block ID) not the ones given in QGIS to assign slivers?</p> <p>Thanks!</p>
