Crashes QGIS or corrupts data:	No	**Copied to github as #:**	26964	

Description

I've installed the reffunctions plugin that provides a set of new functions that have a help associated
When ctrl+click one of the references functions (eg, geomnearest) in an expression, instead of showing its help, QGIS displays the help frame with the following wrong message

> *function help for geomnearest missing*

I did not test with custom function created with the function editor. May be worth checking also.
