Pull Request or Patch shapplied: Resolution:

Easy fix?: Yes Copied to github as #: 26969

Description

Can you add the option of re-projecting coordinates to US Survey feet?

I'm thinking you're using international feet in your units.

There's a difference of several feet when your coordinates are in the millions of feet (actual difference is about 2 feet for every million units)

*U.S. survey foot is exactly 1,200/3937 (10 decimal places)

*International foot is exactly 12x0.0254 (4 decimal places)

*National Institute of Standards & Technology

That would help us out considerably if you could address this issue.

Love QGIS!!

History

#1 - 2018-06-08 07:21 PM - Matthias Kuhn

- Resolution deleted (up/downstream)
- Priority changed from High to Normal
- Subject changed from units of measure -please FIX ... ?? to Add US Survey Feet as Unit Type
- Tracker changed from Bug report to Feature request

#2 - 2018-06-11 12:48 AM - Nyall Dawson

- Status changed from Open to Feedback

Is this just a matter of adding survey feet/miles as a unit choice to the measure tool? Or does it go deeper than that?
