<b>Description</b>		
<p>I installed Quantum GIS 1.0.2 under Kubuntu 8.04 (using Qt 4.3.4).</p> <p>I downloaded the Alaska example dataset and worked through some of the examples in the Quantum GIS (Version 1.0.0) User Guide.</p> <p>I tried using example from the User Guide that concerns the Actions Tab that is part of the Vector Properties Dialog (page 40 on). In the example, you use lakes/lakes.gml, select "Layer Properties" and then "Actions." I supplied the following action:</p> <p>/usr/bin/konqueror <a href="http://www.google.com/search?q=%NAMES">http://www.google.com/search?q=%NAMES</a></p> <p>When I next called up Konqueror and clicked on ANY non-internal hyperlink (i.e., one for any URL on the Internet), then a Konqueror dialogue box came up that said:</p> <p>"Open with 'Quantum GIS' "</p> <p>I was given no choice to decline this option. If I accepted, then QGIS loaded and I get the error message "The layer is not a valid layer and can not be added to the map".</p> <p>I have since deleted the konqueror/Google-search action from the Actions Tab and rebooted my machine, but clicking on any non-internal URL from Konqueror still produces the behaviour just described.</p> <p>(Incidentally, I created another QGIS action to do a Google search with Firefox, but that has had no effect on doing a Google search etc from Firefox.)</p>

Hi,

please upgrade to 1.3, it was a big jump forward since 1.0.x

I cannot replicate the problem with qgis 1.3 and konqueror under ubuntu 9.04.

Please try reset your konqueror file/mime type association configuration and see if it happens again under qgis 1.3
