

QGIS Application - Bug report #20080

Saving Memory Layer to a file misses Scaling part of the CRS

2018-10-11 06:28 PM - Keith Johnson

Status: Open	
Priority: Normal	
Assignee:	
Category: Projection Support	
Affected QGIS version: 3.2.3	Regression?: No
Operating System:	Easy fix?: No
Pull Request or Patch supplied:	Resolution:
Crashes QGIS or corrupts data:	Copied to github as #: 27902
Description	
<p>I created a custom CRS based on a state plane, and added a +k_0 parameter to make ground references in an image measure correctly.</p> <p>I reprojected a layer of existing vectors into this new CRS in a temporary/memory layer. The features projected correctly onto the map.</p> <p>However, when I used "Layer/Save As..." to save to a file, the saved layer "jumped" to a new location (tested with both geopackage and shapefiles, same behavior).</p> <p>The CRS listed in the Source Tab for the layer properties is NOT my named custom projection, but a USER:100.... that does not include a +k_0 parameter.</p> <p>When I select my custom projection to change the CRS, the feature jumps back to its proper location.</p> <p>So apparently, when saving a layer to a file, not all of the PROJ4 parameters are being included in the CRS of the saved file. This may affect more parameters than just scaling, but I have not tested any others.</p> <p>Keith</p>
