I am trying to implement a method to edit features in different geometry type. To start with, I found following example code from the book "BUILDING MAPPING APPLICATIONS WITH QGIS", but it always crashes when I call the method of self.feature in the function canvasMoveEvent. In function canvasPressEvent, it seems to work fine.

I tried to execute the code in a clean profile, but it still crashes. Then I tried with QGIS 2.18 and it worked there. I have attached the report below.

```python
@class MovePointTool(QgsMapToolIdentify):
  def init(self, mapCanvas, layer):
    QgsMapToolIdentify.__init__(self, mapCanvas)
    self.setCursor(Qt.CrossCursor)
    self.layer = layer
    self.dragging = False
    self.feature = None
  def canvasPressEvent(self, event):
    found_features = self.identify(event.x(), event.y(), [self.layer], self.TopDownAll)
    if len(found_features) > 0:
      self.dragging = True
      self.feature = found_features[0].mFeature
      print (self.feature.id())
    else:
      self.dragging = False
      self.feature = None
  def canvasMoveEvent(self, event):
    if self.dragging and self.feature:
      point = self.toLayerCoordinates(self.layer, event.pos())
      geometry = QgsGeometry.fromPointXY(point)
      print (self.feature.isValid())
      print (self.feature.id())
      self.layer.changeGeometry(self.feature.id(), geometry)
      self.canvas().refresh()
  def canvasReleaseEvent(self, event):
    self.dragging = False
    self.feature = None

tool = MovePointTool(iface.mapCanvas(), iface.activeLayer())
iface.mapCanvas().setMapTool(tool)
```
Crash Report:

Crash ID: 46eec519cad6876ebf2347eb73a9fc7f3df167fa

QGIS Info

QGIS Version: 3.4.1-Madeira
QGIS code revision: 383851c597
Compiled against Qt: 5.11.2
Running against Qt: 5.11.2
Compiled against GDAL: 2.3.2
Self.feature = QgsFeature(found_features[0].mFeature)

Copying the feature seems to fix the problem

self.feature = QgsFeature(found_features[0].mFeature)
