<b>Crashes QGIS or corrupts data:</b>	<b>Copied to github as #:</b> 28924
<b>Description</b>	
<p>hi,</p> <p>I'm using a macbook pro with high Sierra</p> <p>I installed 3.4.4 and it didn't open, on the crash window I saw that it was looking for GEOS.framework 3 I checked and I have the 3B version so I change the name and re-launch then it was looking for the version 3B ;)</p> <p>I went to Kynngchaos and took the last GDAL package and the old geos.framework 3.6.1-1 install the whole things and it works ;)</p> <p>I still have 2 issues though.</p> <ul style="list-style-type: none"><li>- the 'save project' box coming out of the blue even no project is open, so I disable it from the preference panel.</li><li>- when georeferencing with Qgis window full screen if I use the map canvas to place my point the window closes and Qgis don't crash and close but I loose the control of it and I have to force quit. If I do the same not on full screen the window still close but I can re-open it from the dock and access the map then the same thing happen with the next point if I use the map canvas button to place my point.</li></ul> <p>hoping I'm clear enough, if not, ask and I'll go in more details</p> <p>Have a nice day</p> <p>Patrick</p>
