Trying to load a zipped shapefile on QGIS throws a warning message in the OGR log, but the layer is loaded anyway.

2019-02-13T21:10:04 WARNING Cannot open C:\Users\user\Desktop\albu.zip()

This happens when you load the layer using the Add vector layer option and by drag and drop, but not when the Browser panel is used.

This does not happen on QGIS 2.18

I can verify this, but it is even worse: it also happens to GPKG files when using drag & drop.
