Easy fix?: No	Copied to github as #: 29208
Description	
<p>At the moment, the only way to "LISTEN" to postgres database is through QgsProvider or QgsMapLayer. This inevitably needs to target a layer. It would be nice if the project itself (QgsProject) could be set up to listen to postgres and its respective signals.</p> <p>The reason behind is that I have several plugins with different tables (task allocation, chat, notifications) with loaded layers (with set notify, refresh and repaintRequested) and signals, that leaves me with 3 permanent established connections to postgres.</p> <p>- Using Python to "LISTEN" crashes as stated here: https://gis.stackexchange.com/questions/305219/qgis-3-python-plugin-psycpg2-postgres-notify-listen-live-connection</p> <p>The only solution I can think of at the moment is to create a single table that stores my notify signals in postgres and use it to spread the signals in Qgis. However, this is a dodgy solution, so having the project to listen would open up a new world of possibilities, in my opinion.</p> <p>-----</p> <p>Also, the class QgsMapLayer contains 3 typos("Nofify"? -> setRefreshOnNofifyMessage, mIsRefreshOnNofifyEnabled, mRefreshOnNofifyMessage</p> <p>Many thanks.</p>
