Easy fix?:	No	**Copied to github as #:**	29512

Description

I love that one is easily able to load/copy/reference data from other QGIS projects by using the browser. Pretty neat way to ensure one can easily find data they've used.

However, I've noticed a number of shortcomings with the current implementation:
1) Layers list ordering not respected

2) Groups cannot be added by right-click or drag/drop

3) Styling, filters, and other rules not carried over upon import to other project.

4) Option to copy style/filter/rules independent of the layer itself would also be sweet.

5) Show memory layer status/icon if they are memory layers (especially for systems when Memory Layer Saver is active)
