| Description | | |
| <p>I joined a table layer to some geodata. Now some features got new attribute values while others got NULL values.</p> <p>It would be very handy to be able to quickly assess the success of a join.</p> <p>For that one would need to see:</p> <ul style="list-style-type: none">- The total number of features on the parent layer (the one joined TO)- The number of features on said layer for which a matching row in the JOINED layer was found <p>The Layer Properties -> Joins dialog could get a new column for that, showing e.g. "123/5000" or "5000/5000". I added two rough mockups.</p> | | |
