During SAGA Image analysis all of modules based on OpenCV don't work with the same output - Error select a library. I can see that this is the common issue, but couldn't manage to solve it.

I have tried installing QGIS on Windows 7, Windows 10, Ubuntu 18 (64 bit). I have tried it on QGIS 3.0, 3.4 and 3.6 - installed as standalone and via Osgeo - the result is the same.

Is there any way to solve it?
there are several image classification tools, can you specify one? It also be useful if you can attach a minimal project+data we can use to test.

I am trying some of the machine learning modules, for example, Artificial Neural Network. I am attaching one satellite image via link and one shapefile with test samples in it.

unsure about the results (you didn’t attached the training areas), but the tool works here.

Please provide a test data and step-by-step instructions how to reproduce the issue. Also please report which SAGA version do you use.
