Category:	GUI			
Affected QGIS version: 3.4.3		Regression?:	No	
Operating System:		Easy fix?:	No	
Pull Request or Patch swapplied:		Resolution:		
Crashes QGIS or corru ptis data:		Copied to github as #: 29709		
Description				

On the Joins Page (layer properties), I've created a join. Several things:

a) Double clicking on the join brings up join info dialog. Pressing cancel closes the info but then expands the join info. Double clicking the title again does the same again (dialog, cancel = un-expand). It should Only bring up the dialog, not affect the expanded/shrunk-ness.

b) It's not possible to double-click any of the children (when expanded) to bring up the dialog.

c) Selecting any of the children and then clicking "edit" or "remove" doesn't do anything. Only selecting the title seems to affect these buttons.
