

QGIS Application - Feature request #22032

Allow join fields to use expressions

2019-05-09 01:07 PM - Admire Nyakudya

Status:	Open	Resolution: Copied to github as #: 29846
Priority:	Normal	
Assignee:		
Category:	Attribute table	
Pull Request or Patch supplied:		
Easy fix?:	No	
Description		
<p>I have two tables (Table A, Table B) with columns name. I needed to use these columns to create my join but once I join them I realize that they are no records that have joined because of the differences between title case for the two columns. Table A contains values in Uppercase and table B contains data in lowercase. It would be nice to include the option to use an expression on the target field/join field when doing a join ie</p> <p>Table A has name = UpperCase</p> <p>Table B has name = Lowercase so when we do the join we could use the expression Upper(name) on the target field.</p> <p>This would prevent having to edit the raw data by updating it or creating a new virtual field or using SQL for people who are not good in SQL (virtual layers).</p>
