Status: Open			
Priority: Normal			
Assignee: Jürgen Fischer			
Category: Windows Package			
Affected QGIS version: 3.6.2		Regression?:	No
Operating System: Windows 8.1		Easy fix?:	No
Pull Request or Patch supplied:		Resolution:	
Crashes QGIS or corrupts data:		Copied to github as #: 29908	
Description			
<p>Hello,</p> <p>I have 1.5gb on my C drive (yes, it is small, it's a SSD) and chose to install QGIS wholly on my E drive.</p> <p>After a minute of installing, my computer crashed some applications, then terminated the install process and I found the cause was QGIS had dump over 1Gb of data on my C drive.</p> <p>There really is no need to do this. When you select to install on a specific drive, it should do that.</p> <p>Regardless, even if it needs to use C drive temporarily or permanently, it should be doing a disk size check to say whether it can install, rather than just crashing.</p> <p>Now, of course, I need to figure out where all these files have been dumped because the installer has closed down as well.</p> <p>thanks.</p>
